### 1.2 Importação de Bibliotecas Principais

```
1 import pandas as pd
2 import re
3 import numpy as np
4 import matplotlib.pyplot as plt
5 from transformers import pipeline
6 from itertools import combinations
```

## 2. CARREGAMENTO DOS DADOS

2.1 Carregar Dataset com Textos Completos

**Descrição:** Carregue o arquivo `decisoes_extraidas.csv` gerado após scrapping de PDF's e extração do texto de decisão, feitos no NOTEBOOK 1.

**Localização:** `..\data\notebook1\decisoes_extraidas.csv`

**Obs:** Carregamento pode demorar um pouco

```
1 df = pd.read_csv("decisoes_extraidas.csv", sep=';')
2
3 print(f"Shape do dataset: {df.shape}")
4 df.head()
```

Shape do dataset: (805, 3)

	arquivo	numero_processo	decisao_completa

Próximas etapas: [Gerar código com df](#) [New interactive sheet](#)

3. EXTRAÇÃO DE ENTIDADES E INFERÊNCIA DE GÊNERO

3.1 Carregamento do Modelo NER (LeNER-BR)

**Descrição:** Carregamento do modelo LeNER-BR, um BERT fine-tuned para reconhecimento de entidades nomeadas em textos jurídicos brasileiros (identifica nomes de pessoas, organizações, locais)

**Hugging Face** 🐼: <https://huggingface.co/pierreguillou/ner-bert-base-cased-pt-lenerbr>

```
1 from transformers import pipeline
2
3 # Modelo NER especializado em textos jurídicos brasileiros
4 ner_pipeline = pipeline(
5     "ner",
6     model="pierreguillou/ner-bert-base-cased-pt-lenerbr",
7     aggregation_strategy="simple"
8 )
```

```
/usr/local/lib/python3.12/dist-packages/huggingface_hub/utils/_auth.py:94: UserWarning:
The secret `HF_TOKEN` does not exist in your Colab secrets.
To authenticate with the Hugging Face Hub, create a token in your settings tab (https://huggingface.co/settings/tokens), set it as secret
You will be able to reuse this secret in all of your notebooks.
Please note that authentication is recommended but still optional to access public models or datasets.

Device set to use cuda:0
```

3.2 Função de Detecção de Título (Juiz/Juíza)

**Descrição:** Função que busca por padrões de "Juiz" ou "Juíza" nos últimos 2000 caracteres do texto (onde geralmente está a assinatura). Usa regex com normalização para capturar variações ortográficas.

```
1 def detectar_titulo_juiz(texto):
2     """
3     Procura no texto ocorrências de 'Juiz' ou 'Juíza' e retorna:
4     - 'Juiz' se a última ocorrência for masculina
5     - 'Juíza' se a última ocorrência for feminina
6     - 'N/A' se não encontrar nada confiável
7     """
8     if not texto:
9         return "N/A"
10
11     # Olhando no fim do texto onde geralmente está a assinatura
12     trecho_fim = texto[-2000:]
13
14     # Padrão regex para capturar variações de Juiz/Juíza
15     padrao = r"Ju[íi]z(a)?"
16
17     # Busca pelo padrão ignorando capitalização
18     judge_search = re.search(padrao, trecho_fim, flags=re.IGNORECASE)
19
20     # Caso não encontrado -> N/A
```

```

21     if not judge_search:
22         return "N/A"
23
24     # Recupera o termo encontrado
25     judge = judge_search.group(0)
26
27     # Decisão: se termina com 'a' → Juíza, senão → Juiz
28     if "a" in judge.lower():
29         return "Juíza"
30     else:
31         return "Juiz"

```

### 3.3 Função de Inferência de Gênero do Juiz

**Descrição:** Converte o título detectado em categoria de gênero.

```

1 def inferir_genero_juiz_por_titulo(texto):
2     """
3     Usa o título para inferir o gênero do juiz(a).
4     """
5     titulo = detectar_titulo_juiz(texto)
6     if titulo == "Juiz":
7         return "Masculino"
8     elif titulo == "Juíza":
9         return "Feminino"
10    else:
11        return "N/A"

```

### 3.4 Aplicação das Funções ao Dataset

```

1 df["titulo_juiz"] = df["decisao_completa"].apply(detector_titulo_juiz)
2 df["genero_juiz"] = df["decisao_completa"].apply(inferir_genero_juiz_por_titulo)
3
4 df[["numero_processo", "titulo_juiz", "genero_juiz"]].sample(10, random_state=42)

```

	numero_processo	titulo_juiz	genero_juiz	
192	0200226-69.2022.8.06.0143	Juiz	Masculino	
718	0272599-05.2023.8.06.0001	Juiz	Masculino

328	0204029-56.2022.8.06.0112	Juiz	Masculino	
218	0200436-05.2022.8.06.0052	Juíza	Feminino	
788	0288630-66.2024.8.06.0001	Juiz	Masculino	

### 3.5 Função de Extração de Nomes via NER

**Descrição:** Função para extração de nomes de pessoas usando NER, com múltiplos filtros:

- Exige pelo menos 2 palavras (nome + sobrenome)
- Remove termos institucionais/genéricos
- Exige mínimo de 3 caracteres

**Limitação:** Alguns documentos não têm nomes identificáveis nos primeiros 1000 caracteres (cabecinhos, citações longas, ruído), resultando em "Não identificado".

```

1 def extrair_pessoas_via_ner(texto):
2     """
3     Roda NER no texto e retorna lista de entidades do tipo PESSOA,
4     filtrando tokens quebrados, exigindo pelo menos 2 palavras
5     e ignorando termos institucionais/genéricos.
6     """
7     if not isinstance(texto, str) or texto.strip() == "":
8         return []
9
10    entities = ner_pipeline(texto)
11    pessoas = []
12
13    # Lista de termos que não queremos considerar como "Parte" (Pessoa Física)
14    termos_proibidos = [
15        "justiça pública", "justica publica",

53         "end": ent.get("end", None),
54     })
55
56 return pessoas

```

### 3.6 Função de Extração de Nomes das Partes (Estratégia Híbrida)

**Descrição:** Função principal de extração com estratégia híbrida em 3 camadas:

- Regex formal: Busca por "Requerente:", "Autor:", "Paciente:"
- Regex narrativa: Busca por "ajuizada por", "intentada por", "promovida por"
- NER fallback: Usa modelo de NLP quando padrões textuais falham

**Importante:** Analisa apenas os primeiros 1000 caracteres para otimizar performance.

### 3.10 Carregamento do Modelo Zero-Shot Classification (Bart-Large-MNLI)

**Descrição:** Carregamento do modelo facebook/bart-large-mnli, um modelo BART de grande porte treinado no dataset MultiNLI (MNLI), utilizado para classificação de textos em zero-shot para tarefas de classificação, análise de conteúdo e rotulagem. Em nosso caso, a análise do gênero baseado no nome da parte

**Hugging Face** 🤗: <https://huggingface.co/facebook/bart-large-mnli>

```
1 classifier = pipeline("zero-shot-classification", model="facebook/bart-large-mnli")
2
```

Device set to use cuda:0

### 3.11 Função de Inferência de Gênero da Parte (via Nome com Zero-Shot)

```
1 def identificar_genero(nome):
2     """
3     Usa zero-shot classification para inferir o gênero a partir do PRIMEIRO nome.
4     Retorna 'Masculino' ou 'Feminino'.
5     """
6     if not isinstance(nome, str) or nome.strip() == "" or nome == "Não identificado":
7         return "N/A"
8
9     # Pegar apenas o primeiro nome para evitar ruído dos sobrenomes
10    primeiro_nome = nome.strip().split()[0]
11
12    labels = ["Masculino", "Feminino"]
13
14    resultado = classifier(
15        primeiro_nome,
```

```

16     candidate_labels=labels,
17     hypothesis_template="Este nome pertence ao gênero {}."
18 )
19
20 # O pipeline retorna ordenado por score decrescente, então o índice 0 é o vencedor

```

### 3.12 Aplicando a função de indentificação de gênero para a parte

```

1 df["genero_parte"] = df["nome_parte"].apply(identificar_genero)
2
3 df[["numero_processo", "nome_parte", "genero_parte", "titulo_juiz", "genero_juiz"]].head()

32 _____
33
34 Classifique o TOM predominante do texto em **APENAS UMA** das categorias abaixo:
35
36 • **EMPATICA**
37   - Linguagem humanizada ou acolhedora
38   - Demonstra preocupação com dignidade, sofrimento, vulnerabilidade ou situação pessoal da parte
39   - Uso de expressões que reconhecem contexto social, humano ou existencial
40   - Mesmo quando técnica, apresenta sensibilidade explícita
41
42 • **TECNICA**
43   - Linguagem neutra e impessoal
44   - Fundamentação jurídica objetiva
45   - Predomínio de dispositivos legais, precedentes, conceitos jurídicos
46   - Ausência de juízo emocional positivo ou negativo
47
48 • **RIGOROSA**
49   - Linguagem dura, fria ou excessivamente formal
50   - Tom repreensivo, censório ou de pouca concessão
51   - Ênfase em limites legais sem contextualização humana
52   - Eventual censura moral, reprovação ou desconsideração da situação da parte
53

## 7.1 Definição de Padrões de Decisão e Âncoras

**Descrição:** Padrões regex para identificar termos decisórios e âncoras textuais que marcam o início da parte dispositiva da sentença.

```
1 import re
2
3 # 1) Decisões
4 padroes_decisao = re.compile(
5     r"(?is)\b("
6     r"julgo|"
7     r"defiro|indefiro|"
8     r"procedente|improcedente|"
9     r"parcialmente\s+procedente|"
10    r"extingo|"
11    r"condeno|"
12    r"homologo|"
13    r"nego\s+provimento\dou\s+provimento|"
14    r"rejeito|acolho"
15    r")\b"
16 )
17
18 # 2) Âncoras para decisões
19 padroes_ancora = re.compile(
20     r"(?im)\b("
21     r"(?:do\s+)?dispositivo\b(?:s)|"
22     r"ante\s+o\s+exposto|"
23     r"isso\s+posto|isto\s+posto|"
24     r"pelo\s+exposto|por\s+todo\s+o\s+exposto|"
25     r"diante\s+disso|diante\s+do\s+exposto"
26     r")\b"
27 )
```

## 7.2 Função de Extração do Trecho Decisório

**Descrição:** Extrai o trecho relevante da decisão judicial (dispositivo) usando âncoras textuais e padrões de decisão.

**Estratégia:**

1. Analisa apenas o final do documento (últimos 20.000 caracteres)
2. Prioridade: última âncora encontrada
3. Fallback: última semente de decisão
4. Fallback final: final do texto

**Justificativa:** O sentimento mais relevante está na parte decisória (dispositivo), não no relatório ou fundamentação.

```
1 def extrair_trecho_decisao_simples(texto: str, n_chars: int = 4096, janela_back: int = 20000, lado: str = "inicio") -> str:
2     """
3     Retorna APENAS o trecho decisório.
4     lado:
5         - "inicio": pega os PRIMEIROS n_chars após âncora/decisão (ideal p/ 512)
6         - "fim":     pega os ÚLTIMOS n_chars do trecho após âncora/decisão (ok p/ 4096)
7     """
8     if not isinstance(texto, str) or not texto.strip():
9         return ""
10
11     tail = texto[-janela_back:] if len(texto) > janela_back else texto
12     offset = len(texto) - len(tail)
13
14     start = None
15
16     # 1) tenta âncora
17     anc = list(padroes_ancora.finditer(tail))
18     if anc:
19         m = anc[-1]
20         start = offset + m.end()
21     else:
22         # 2) tenta decisão
23         dec = list(padroes_decisao.finditer(tail))
24         if dec:
25             m = dec[-1]
26             start = offset + m.start()
27
28     # 3) fallback
29     if start is None:
30         trecho = texto[-janela_back:]
31     else:
32         trecho = texto[start:]
33
34     if lado == "fim":
35         return trecho[-n_chars:].strip()
36     else: # "inicio"
37         return trecho[:n_chars].strip()
```

### 7.3 Aplicação da Extração para Diferentes Tamanhos

**Descrição:** Extração de trechos decisórios em dois tamanhos diferentes:

- **512 caracteres:** Para modelos BERT padrão
- **4096 caracteres:** Para modelos Longformer

```
1 df = pd.read_csv("decisoes_classificadas_cs_llm.csv", sep=";")
2
3 df["trecho_decisao_4096"] = df["decisao_completa"].astype(str).apply(
4     lambda t: extrair_trecho_decisao_simples(t, n_chars=4096)
5 )
6
7 df["trecho_decisao_512"] = df["decisao_completa"].astype(str).apply(
8     lambda t: extrair_trecho_decisao_simples(t, n_chars=512)
9 )
```

▼ 7.4 Verificação da Qualidade das Extrações

**Descrição:** Validação de que os trechos extraídos contêm palavras decisórias.

```
1 df["trecho_tem_palavra_decisao_4096"] = df["trecho_decisao_4096"].apply(
2     lambda s: bool(padroes_decisao.search(s)) if isinstance(s, str) else False
3 )
4
5 df["trecho_tem_palavra_decisao_512"] = df["trecho_decisao_512"].apply(
6     lambda s: bool(padroes_decisao.search(s)) if isinstance(s, str) else False
7 )
8
9 # Porcentagens de qualidade
10 print(f"4096 - contém decisão: {(df['trecho_tem_palavra_decisao_4096'].mean() * 100):.2f} %")
11 print(f"512 - contém decisão: {(df['trecho_tem_palavra_decisao_512'].mean() * 100):.2f} %")
12 display(df.sample(5))
```

4096 - contém decisão: 94.68 %  
512 - contém decisão: 91.76 %

25     print("Saída:", s)
26

```

=== BERT ===

Texto: Diante da vulnerabilidade da parte autora e da comprovada necessidade do medicamento, procedente o pedido, assegurando o direito f  
Saída: {'label': '5 stars', 'score': 0.2671985328197479}

Texto: Não restou comprovado o direito alegado. Ausente prova mínima dos fatos constitutivos, julgo improcedente o pedido, nos termos da l  
Saída: {'label': '1 star', 'score': 0.5797569155693054}

=== RoBERTa ===

Texto: Diante da vulnerabilidade da parte autora e da comprovada necessidade do medicamento, procedente o pedido, assegurando o direito f  
Saída: {'label': 'LABEL\_0', 'score': 0.6176493167877197}

Texto: Não restou comprovado o direito alegado. Ausente prova mínima dos fatos constitutivos, julgo improcedente o pedido, nos termos da l  
Saída: {'label': 'LABEL\_0', 'score': 0.6198321580886841}

### 8.3 Conclusão sobre testes realizados acima

**Descrição:** Os testes indicaram que, embora utilize rótulos genéricos de sentimento, o modelo BERT apresentou respostas coerentes com a polaridade dos textos analisados. Já o RoBERTa não distinguiu adequadamente textos semanticamente distintos, por conta disso, continuaremos somente com as análises do modelo BERT.

### 8.4 Funções Auxiliares para Processamento em Batch

**Descrição:** Função para processar múltiplos textos em batches, otimizando performance.

```

1 def _rodar_pipeline_em_batch(textos, pipe, batch_size=8):
2     """
3     Roda pipeline em batches e retorna lista de dicts [{'label':..., 'score':...}, ...]
4     Mantém alinhamento com a lista de entrada.
5     """
6     textos = list(textos)
7     out = []
8     for i in range(0, len(textos), batch_size):
9         batch = textos[i:i+batch_size]
10        # garante string
11        batch = ["" if (not isinstance(t, str)) else t for t in batch]
12        preds = pipe(batch)
13        out.extend(preds)
14    return out

```

### 8.5 Funções de Transformação de Resultados

**Descrição:** Conversão dos labels do BERT (1-5 stars) para categorias interpretáveis.

**Mapeamento:**

- 1-2 stars → RIGOROSA (linguagem restritiva, negativa)
- 3 stars → TECNICA (linguagem neutra, formal)
- 4-5 stars → EMPATICA (linguagem favorável, acolhedora)

```

1 def bert_label_to_int(label: str):
2     # '1 star'...'5 stars' -> 1..5
3     import re
4     m = re.search(r"(\d)", label)
5     return int(m.group(1))
6
7 def map_1_5_to_sentimento(valor_1_5: float):
8     """

```

```
9 Mapeamento simples p/ ficar comparável com LLM:
10 1-2 -> RIGOROSA
11 3 -> TECNICA
12 4-5 -> EMPATICA
13 ""
14 v = int(valor_1_5)
15 if v <= 2:
16     return "RIGOROSA"
17 elif v == 3:
18     return "TECNICA"
19 else:
20     return "EMPATICA"
```

8.6 Aplicação do BERT no Dataset Completo

**Descrição:** Análise de sentimento em todos os trechos decisórios de 512 caracteres.

```
1 import pandas as pd
2 df = pd.read_csv("decisoes_classificadas_cs_llm_regex.csv", sep=";")
3
4 # --- BERT (512) ---
5 preds_bert = _rodar_pipeline_em_batch(
6     df["trecho_decisao_512"].tolist(),
7     bert_pipeline,
8     batch_size=16
9 )
10
11 df["analise_bert_label"] = [p.get("label") for p in preds_bert]
12 df["analise_bert_1a5"] = df["analise_bert_label"].apply(bert_label_to_int)
13 df["analise_bert"] = df["analise_bert_1a5"].apply(map_1_5_to_sentimento)
```
